

Research Aim and Rationale

This study investigates how major AI companies (e.g., Microsoft, OpenAI, Google, Meta, Anthropic, and Coursera) envision the role of Artificial Intelligence in higher education. It explores differences and similarities in their strategic narratives, partnerships, and technologies, shedding light on the underlying values, assumptions, and economic interests driving their educational agendas.

Key Motivation

AI companies increasingly shape higher education through products (e.g., Microsoft Copilot, Google Gemini), collaborations, and policy influence. Yet, their visions vary—from automation of teaching to human-AI collaboration and personalized learning. Understanding these visions helps educators, policymakers, and researchers anticipate the implications for learning design and institutional autonomy.

Research Questions:

1. How do major AI companies describe the role of AI in higher education?
2. What educational problems do they claim AI can solve?
3. What values (e.g., efficiency, accessibility, creativity, equity) underpin their narrative?

Methodology

Data Collection: white paper, blog posts, strategy papers etc.

Data Analysis: text mining + topic modeling + visualization in knowledge graph

Expected outcomes:

1. Typology of AI visions (e.g., efficiency-driven, augmentation, education equality etc.)
2. Comparative map of company's educational narratives and strategies
